                                                                                                                                             Alignment Scores:
                                               US-10-030-271-1 (1-909)
                                                                                                                                                                                                 The invention relates to a novel human apoptosis-associated factor (AAB60386, AAB60387), designated NTZRM1000558, which contains a death effector domain (DED) and a caspase family cleavage domain and is capable of inducing apoptosis in cells. The invention also relates to nucleic acids encoding the protein (AAF27407, AAF27408); variants of the protein (particularly dominant negative variants); vectors and host cells comprising a nucleic acid which encodes an apoptosis- associated factor of the invention; the recombinant production of the protein; an antibody against the protein; and methods of screening for compounds which can regulate apoptosis. The apoptosis-related factor is useful in regulating diseases associated with cell proliferation and in screening drug candidates e.g., for regulating cell proliferation or cell death in ischaemic diseases and chronic viral diseases. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of genes encoding 9 human apoptosis-related proteins. The nucleotide sequences AAA95790-A95798 encode the human apoptosis related proteins BAB1559. The genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc (19g Fc) portion (AAA95799) for increasing the stability of the fusion protein as compared to the human protein only. The gene and encoded protein may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate apoptosis associated protein expression, e.g. cancer (e.g. colon, breast and prostate cancer, melanomas and lymphomas), inflammation, autoimmune disorders (e.g. co.g. herpes))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding human apoptosis associated protein, useful for the prevention, treatment and diagnosis of e.g. Alzheimer's and Parkinson's disease, inflammation and ischemic injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-Alzheimer; gene therapy; human; apoptosis; fusion protein; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention relates to an isolated polypeptide comprising a death CC domain (DD), death effector domain (DD) or NB-ARC domain. The invention is useful for identifying a binding agent, preferably a protein or a drug CC that binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC Commain, by contacting a DD, DED or NB-ARC CONTACTING a DD protein), DED4 or CC NDD (NGFR-interacting Death Domain), with a candidate binding agent, by yeast two hybrid assay, immunoprecipitation, SPA, ultraviolet (UV) or CC contacting the association of the domain and the candidate binding agent, cc spectroscopy (MS) and FPA. The invention is useful for modulating the CC level of a cell process such as cell proliferation, cell adhesion, cell stress responses, responses to microbial infection and B cell communoglobulin class switching, in particular apoptosis within a cell. CC muridarum, C. pneumoniae, and C. psittaci or a nucleic acid encoding the CTDD DD protein is useful for medulating the activity of oncogenic proteins, cc contributed by protein is useful for modulating the activity of oncogenic proteins, cc contention is useful for modulating the activity of oncogenic proteins and for contents. The protein and antibody specific for it are useful for contents by modulating the activity of bacterial contents. The protein and antibody specific for it are useful for contents and for its useful for treating immune-based pathologies, pathologies associated with cell division, inflammatory diseases such as sepsis, fibrosis, cc arthritis, graft versus host diseases. The invention is used in antisense contents and gene therapy. The present sequence is human DED4 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                      598
                                                                                                                                                                                                                                                                                      180

The invention is useful for CC identifying a binding agent (e.g. protein or drug) that binds a DD, DED CC or NB-ARC domain from DAP3, IRAK4, CTDD, DEDA or NIDD with a candidate binding agent and identifying an effective agent (e.g. protein or drug) that modulates the association of a DD, DED or NB-ARC domain with protein CC that binds the DD, DED or NB-ARC domain. The invention is also useful for CC modulating the level of cell process such as apoptosis, cell adhesion, CC cell proliferation, cell stress responses, responses to microbial CC infection and B cell immunoglobulin class switching. DDs, DEDs and NB-ARC domains and/or anti-DD, anti-DED or anti-NB-ARC domain antibodies are CC useful for discovery of drugs that suppress infection, autoimmunity, inflammation, allergy, that suppress infection, autoimmunity, cC autoimmunity, inflammation, allograft rejection, sepsis and other diseases. CD, DED or NB-ARC domain proteins are used to treat infection, allergy, cautoimmunity, inflammation, allograft rejection, sepsis, keratinocyte conflammatory hyperplasia, keloid, benign prostatic hypertrophy, fibrosis, cc inflammatory hyperplasia and smooth muscle cell proliferation in arteries conflammatory the protein in a p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5
The invention provides human apoptosis regulator (APRG) polypeptides and C polynucleotides. The APRG polypeptides, polynucleotides and modulators care useful for diagnosis, treatment and prevention of cell proliferative, climmunological and reproductive disorders. The cell proliferative, CC disorders include cancers, actinic keratosis, arteriosclerosis, communological disorders include acquired immunodeficiency syndrome (C AIDS), adult respiratory distress syndrome, Addison's disease, CC ankylosing spondylitis, amyloidosis, allergies, anemia, osteoporosis, autoimmune hemolytic anemia, asthma, autoimmune thyroiditis, Crohn's CC ankylosing spondylitis, amyloidosis, allergies, anemia, systemic lugus collegementosus, systemic sclerosis, ulcerative colitis, baemodialysis, curvitis; viral, bacterial, fungal, parasitic, protozoal, helminthic C uveitis; viral, bacterial, fungal, parasitic, protozoal, helminthic C infections and trauma. Reproductive disorders include disorders of prolactin production, infertility, endometriosis, polycystic ovary c syndrome, ectopic pregnancies, galactorrhea, abnormal sperm physiology, conscituing production, infertility, endometriosis, polycystic ovary c syndrome, ectopic pregnancies, galactorrhea, abnormal sperm physiology, conscituing the presst and gynecomastia. The APRG polynucleotides are useful for creating knockin humanized animals or transgenic animals to model human disease and to detect and quantify gene expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human apoptosis regulator polypeptides and polynucleotides for diagnosing, preventing, treating cell proliferative, immunological and reproductive disorders and for identifying modulators of therapeutic us
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-10-030-271-1 (1-909) x ABB07263 (1-326)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ននិននិង
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                biopsied tissues in which expression of APRG is correlated with disease. APRG, fragments of it and antibodies specific for APRG are useful as elements on a microarray which is useful to monitor or measure protein-protein interactions, drug-target interactions and gene expression profiles. The present sequence represents a human APRG polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 326

Also described: (1) primer and probe for investigatior of the DEDD2 gene; and (2) reagents for gene therapy. DEDD2 has cytostatic activity. DEDD2 can be used in the diagnosis and treatment of cancers of the kidney, large intestine and prostate, and acute and chronic myeloid leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; death effector domains containing DNA-binding protein; DED-containing DNA-binding protein; DEDD2; cell death; gene t cytostatic; cancer; chronic myeloid leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              占
AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P

Lung cancer
CC associated proteins and polynucleotide sequences, their agonists, and
CC antagonists may have neuroprotective; cytostatic; cardioactive;
CC immunomodulatory; muscular active general; vulnerary; gastrointestinal
CC general; nephrotropic; antiinfective; gynecological; or antibacterial
CC or polynucleotide sequences. The lung cancer associated polynucleotide
CC sequences may be used for detection of lung cancer, chromosome
CC identification, as chromosome markers, and for numerous other diagnostic
CC or research purposes. The proteins may be used to treat disorders such as
CC neural, immune, muscular, reproductive, gastrointestinal, pulmonary,
CC cardiovascular, renal, and proliferative disorders. The proteins may also
CC used in the treatment of wounds and infectious diseases.
CC used in the course of the invention for the identification and
CC used in the course of the invention for the identification and
CC characterisation of the polynucleotide and protein sequences

The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory, antirheumatic; creatiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; CC central nervous system, virucide; anti-HIV; fungicide; antiamtagen; CC cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; CC antivicer; osteopathic; dermatological; antiallergic; antiasthmatic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antidiabetic; cytostatic; neuroprotective; antisense therapy and vaccine conding them can be used in gene therapy, antisense therapy and vaccine conduction. The proteins and polynucleotides are useful for screening for cagonists or antagonists of a protein and for the treatment and diagnosis cof disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, corneuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal conference and constant of the protein and constant of the constan
